SUMMARY

Senior Software Engineer with 5+ years of experience designing, building, and operating scalable backend systems and performant frontend experiences across fintech, SaaS, and data-intensive platforms. Strong in Node.js, TypeScript, PostgreSQL, MongoDB, and Redis with deep experience in distributed systems, REST/GraphQL API design, caching strategies, and event-driven architectures. Proven ability to reduce API latency, strengthen observability, and own full-stack services end-to-end, from data modelling and business logic through deployment, monitoring, and incident response.

KEY SKILLS

Backend Engineering: Node.js 20+, TypeScript 5+, Express.js, Fastify, REST APIs, GraphQL, gRPC basics, API versioning, rate limiting, background workers, WebSockets

System Design: Distributed systems, microservices, service-oriented architecture, modular monoliths, event-driven systems, Pub/Sub messaging, CQRS basics, async processing, idempotency, circuit breakers

Databases & Caching: PostgreSQL 15+, MongoDB, Redis, Prisma ORM, schema design, compound indexing, query optimisation, connection pooling (pgBouncer), read replicas

Frontend: React.js 18+, Next.js 14+ (SSR), React Query, Tailwind CSS, TypeScript, component-driven architecture, web performance tuning

Cloud & DevOps: AWS, Docker, Kubernetes basics, Terraform basics, CI/CD (GitHub Actions), Nginx, environment management

Observability & Reliability: Structured logging (pino/winston), Prometheus/Grafana basics, health checks, distributed tracing, error tracking, performance profiling, SLA management

Security: JWT, OAuth 2.0, RBAC, input validation (zod/joi), rate limiting, OWASP best practices, HTTPS/TLS, secrets management

AI-Assisted Development: Daily use of Claude, Cursor, and GitHub Copilot for code generation, automated testing, refactoring, and documentation

Tooling & Practices: Git, GitHub/GitLab, Jira, Postman, Swagger/OpenAPI, Agile/Scrum, code reviews, ADRs, on-call rotations

WORK EXPERIENCE

Senior Software Engineer | [NexoSphere Finance](#)

March 2024 – Present

- Fintech SaaS platform offering institutional-grade portfolio management, real-time trading dashboards, and financial data infrastructure with AI-driven P2P matching.
- Owned architecture for a large-scale multi-tenant fintech platform, designing Node.js/TypeScript services and React interfaces with clean API boundaries and horizontal scalability.
- Architected microservice boundaries enabling independent deployability, fault isolation, and clear team ownership across service domains.
- Implemented JWT-based authentication and granular RBAC authorisation, securing API access for 5+ distinct internal and external user roles.
- Developed paginated, filterable REST APIs with versioning, powering React analytics dashboards used by thousands of daily active users.
- Reduced average API response latency by ~30% through Redis caching layers, targeted query optimisation, and background-job offloading.
- Built WebSocket services streaming transactional updates and system events to frontend clients with sub-second propagation at scale.
- Improved core database query performance by ~25% through compound indexing, covering indexes, and targeted PostgreSQL/MongoDB schema refactors.
- Defined TypeScript-enforced API contracts, request/response schemas, and error models, reducing frontend integration regressions by ~40%.

- Implemented event-driven async job queues with Pub/Sub patterns, decoupling heavy workloads from synchronous request paths and improving throughput.
- Drove full-stack feature delivery, aligning React frontends with contract-driven APIs and collaborating with PMs and designers on billing and onboarding flows.
- Managed Dockerised deployments and CI/CD pipelines, enabling zero-downtime releases, automated rollbacks, and consistent environments.

Senior Software Engineer | [Fetch.ai](#)

December 2022 – February 2024

- Worked on Metallex ([mettalex.ai](#)), an agentic AI-powered P2P DEX built on EVM + Cosmos SDK, enabling automated liquidity, dynamic fees, and strategy execution via Uniswap v4 hooks.
- Played a key role in full-stack development for a high-traffic trading platform, owning API design, access-control architecture, and data integrity.
- Designed and maintained Node.js/TypeScript services powering trading workflows, user lifecycle management, and audit-friendly RBAC systems.
- Implemented granular RBAC permissions and secure data access patterns, maintaining zero reported access-control violations throughout tenure.
- Built REST APIs consumed by real-time trading UIs, enforcing consistent data contracts, predictable responses, and robust error handling.
- Improved system observability via structured logging and performance instrumentation, cutting average production debugging time by ~30%.
- Optimised database query patterns and API pipelines through Redis caching, reducing redundant data access and improving p95 query times by ~20%.
- Supported full-stack feature delivery by integrating React frontends with backend APIs while maintaining primary Node.js ownership.
- Participated in code reviews, architectural deep-dives, and iterative reliability improvements within an Agile development process.

Software Engineer | [Upwork](#)

March 2020 – November 2022

- Delivered backend-heavy full-stack solutions using Node.js and TypeScript for global clients across fintech, SaaS, and enterprise platforms.
- Designed and implemented systems for user auth, authorisation, file handling, and third-party API integrations with robust retry logic.
- Built REST APIs backed by PostgreSQL and MongoDB with cursor pagination, compound indexing, and Redis caching for sub-100ms p95 responses.
- Developed background job workers and async pipelines for data transformation, notifications, and long-running computational tasks.
- Improved backend performance via query optimisation, connection pooling, structured error handling, and health-check instrumentation.
- Managed Docker-based deployments and CI/CD workflows, maintaining consistent environments and reliable production releases for all clients.
- Worked directly with clients to architect scalable systems with clear API documentation, service boundaries, and deployment runbooks.
