PROFESSIONAL SUMMARY

Senior Backend Engineer with 7+ years of experience designing and shipping high-throughput, concurrent systems and APIs in Go, with supporting work in Node.js/TypeScript and Python. Deep experience building and operating Go microservices on AWS and Kubernetes covering gRPC, REST, and GraphQL and integrating Go backends with Ethereum and EVM blockchain infrastructure. Skilled at leveraging Go's concurrency model (goroutines, channels, context) to drive cost reduction, latency improvements, and reliable backend pipelines under Agile and test-driven workflows.

SKILLS

- **Programming Languages:** Go (primary), Node.js/TypeScript, Python, Java, Solidity, Bash/Shell; Flask, Django
- **Go Ecosystem:** goroutines & channels, context, gRPC, REST, GraphQL, CLI tooling, structured logging, pprof
- **Cloud Platforms:** AWS, GCP, OVH Cloud
- **Containerization:** Docker, Kubernetes, OpenShift
- **Infrastructure:** Terraform, CloudFormation, Pulumi
- **Configuration Management:** Ansible, Chef, Puppet
- **CI/CD:** GitHub Actions, ArgoCD, Jenkins, GitLab CI, CircleCI
- **Monitoring & Logging:** Prometheus, Grafana, ELK, Loki, Datadog, Thanos, OpenTelemetry
- **Blockchain Platforms:** Ethereum, Polygon, Cosmos, EVM chains (go-ethereum / geth)
- **Databases:** MySQL, PostgreSQL, MongoDB, ClickHouse, Cassandra, Redis
- **Operating Systems & Networking:** Linux, Windows Server, Unix, VPN, Firewalls

WORK EXPERIENCE

Senior Backend Engineer - ZeroLend

Sep 2022 - Present

- Designed and scaled GraphQL and REST APIs in **Go** (with supporting services in Node.js and Python), powering blockchain, analytics, and cloud platforms.
- Re-architected backend workflows in **Go**, offloading compute-heavy tasks from frontend to backend and boosting system performance by 30%.
- Built internal developer tools and automation services in **Go** (CLI utilities, smart assistants) to accelerate engineering and customer support workflows.
- Led migration of **Go**-based backend infrastructure to AWS Fargate ECS, improving resource allocation and reducing operational costs by 20%.
- Created in-house **Go** microservices to replace third-party APIs, cutting integration costs by 25%.
- Implemented secure authentication and access control (Okta SSO, RBAC) across **Go** backend services.
- Introduced observability stack (Grafana, Loki, Prometheus) with tailored dashboards for **Go** service diagnostics and reliability.
- Managed Ethereum validators and EVM blockchain nodes handling 10K+ RPS, integrating them with **Go** backend services.
- Automated deployments and infrastructure provisioning for **Go** services with GitHub Actions, ArgoCD, and Terraform (AWS MSK/Kafka).
- Participated in on-call rotation, performed **Go** service security hardening, and drove live vulnerability assessments.
- Collaborated with cross-functional teams on **Go** architecture reviews and long-term backend roadmaps.

Senior Platform Engineer - Synthr

Dec 2020 - Sep 2022

- Architected backend-heavy Kubernetes microservices in **Go** with API integrations and modular codebases (Python for supporting tooling).
- Designed in-house **Go** blockchain services (Ethereum, Polygon, BSC) and integrated smart contract layers via backend APIs.
- Refactored **Go** API call flows to reduce third-party service costs by 40%, improving efficiency.
- Built automation tools in **Go** and Python to manage deployment, infrastructure monitoring, and data workflows.
- Designed ephemeral QA environments integrated with **Go** backend testing pipelines, reducing test feedback loops by 40%.
- Led cloud database migration and schema optimization, enhancing **Go** backend performance and reducing downtime.
- Implemented circuit breakers, service authentication, and structured logging in **Go** backend services for resilience.
- Developed scalable APIs in **Go** alongside TypeScript/Node.js services, boosting throughput and reducing server errors.
- Guided a team of 10+ engineers, managing Agile sprints, **Go** architecture, and feature delivery across DevOps and backend.

Solution Engineer - Techracers

June 2017 - Dec 2020

- Created backend microservices in **Go** (alongside AWS Lambda, Flask, and Node.js) to support product development and QA automation.
- Integrated smart contracts with **Go** backend services, reducing latency and enhancing blockchain transaction reliability.
- Developed a DeFi circuit breaker in **Go** to safeguard transaction integrity and prevent smart contract exploits.
- Built internal analytics dashboards and admin panels using React backed by **Go** API services.
- Led Google Cloud migration of legacy **Go** backend systems using Kubernetes, Helm, and Infrastructure as Code.
- Created load-balancing systems using Envoy to scale **Go** microservices and increase application availability.
- Managed CI/CD pipelines and **Go** backend test automation using GitHub Actions and custom scripting.
